Cypress TSP-2105 Barcode Scanner Kit Manual - Scanner Configuration: TSP

The CR1100 barcode scanner is configured with the three configuration QR codes to the right. They are scanned in order: A4, E4, C2.

The converter unit serial interface is configured for 9600 baud, the scanner baud rate must be configured to match. The last configuration QR code set the unit to scan barcodes automatically when one is presented.

The scanner is preconfigured at the factory to work out of the box for typical applications.

If the default configuration does not work for a specific application, see the configuration options in the CR1100 Configuration Guide found on the product page at codecorp.net.

Below is a test barcode. The default converter setting is Setting 65 (see table on page 12). This barcode should be output by the converter as a 26 bit (H10301) Wiegand read. The facility code value is 123, the card number value is 12345.
